Another great thing about working with tools that were designed to be operated by a mouse is how well software has adapted and added features; you don't have to use your keyboard to make changes to images or build up layers. You can easily add unlimited layers for editing, while viewing all the layers or parts of layers (single, grouped and tagged layers) is easy to maintain. Spotlight is a smart way to search through every single image in your library, so you can find a particular photo, separate it from the others, and make it your own. You can then even include it into any other file, which is quite handy. Adobe does not recommend using the RAW format for images taken in certain situations, such as a camera with a shallow depth of field (when the subject of the photo is in focus whereas everything else isn't). Most professional DSLR cameras use compressed RAW files, which are converted to the standard reversible compressed TIFF format. Effectively, the image begins as RAW data (the image data that Photoshop knows how to decode and understand). However, the standard capture settings often do a poor job of recording the information that Adobe typically needs to create complex images.
